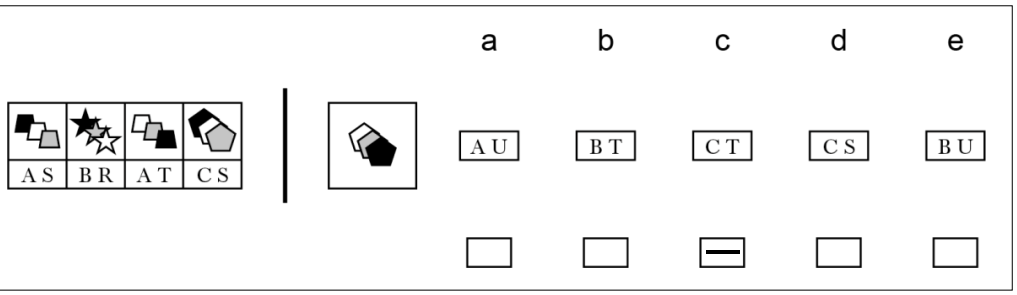
Non-Verbal Reasoning

4. CODE BREAKER / TYPE 4

Example



Explanation

You can work out that A is the trapezium as there are two of them. Therefore this means that B is the star and C is the pentagon. There are two S's in the second letter, so this must mean that S stands for the order of shading being black, white, light. White, light, black is therefore T. So the final answer is CT.

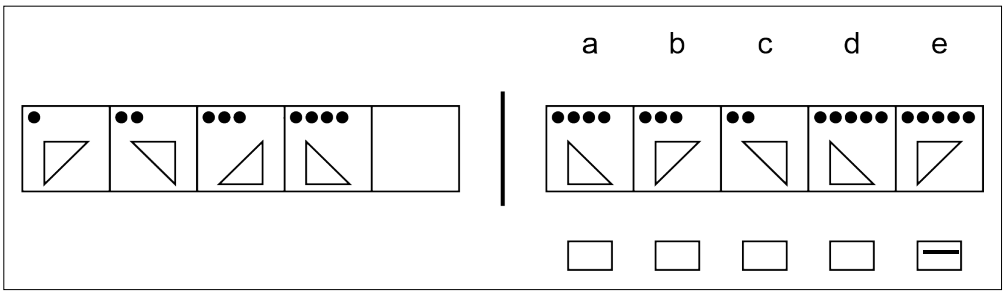
5. MISSING SEQUENCE / TYPE 5

Example



Explanation

The first sequence to look at is that the number of circles at the top of each square is increasing by 1 each time. This means that you know that the answer is either D or E as the final square will have 5 circles. The next part is to look at the triangles which are rotating 90 degrees clockwise each time. This means that you know the final answer is E.

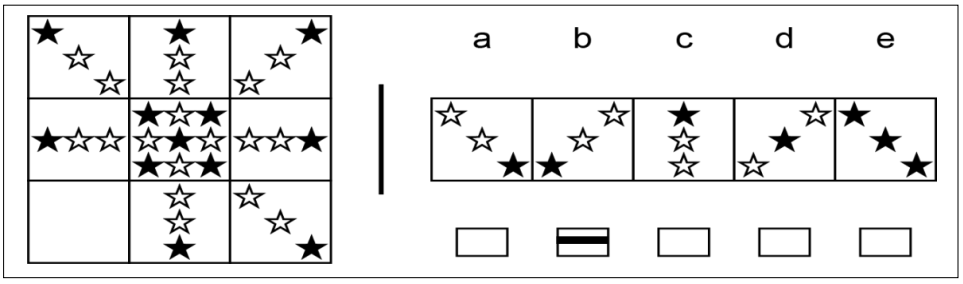
6. MISSING SQUARE / TYPE 6

Example



Explanation

In the three given corner squares, there are three starts, one black in the outermost corner and two white. The direction of the line of stars is always pointing towards the centre square. Therefore the answer must be B.

Non-Verbal Reasoning

Code Breaker

1. **C** - (You can work out that M stands for the shading of the square being white as there are two of them. Therefore, N stands for the shading being black and O stands for lightly shaded. In the right hand letters there are two Ys and the similarity between the two are that there are two stars in each. So, three stars in the square must be Z. So, the final answer is NZ.)
2. **B** - (You can work out that A is the pentagon as there are two of them. Therefore this means that B is the octagon and C is the rhombus. The second letters are all different and as the shapes are always stacked from the back to the front; this means the second letter must be the shading pattern. White, light black is therefore W. So the final answer is CW.)
3. **D** - (You can work out that X is the solid square around the star as there are two of them. Therefore, this means that Y is the dashed square and Z is the dotted square. There are two U's in the second letter, so this must mean that U stands for the light shading of the star. The solid black shading is therefore S. So the final answer is ZS.)
4. **E** - (You can work out that Y stands for there being two wavy lines as there are two of them and it is the only similarity. Therefore, this means Z stands for there being three wavy lines. All of the top letters are different and the only difference between the three of them is the type of shape. So, K stands for the shape being an octagon. So, the final answer is KZ.)

Missing Sequence

1. **D** - (As you move from left to right there are two changes to each square; firstly, the rectangle alternates being a very thick line and a very thin line and secondly, the shape rotates 45 degrees clockwise. Also, every two squares the number of lines increase by two, one line on each side of the shape. The missing square should have a very thick line, it should be horizontal and should have a set of four lines and a set of two lines so the answer must be D.)
2. **B** - (As you move from left to right two things happen in each square; firstly, the pentagon in each corner moves clockwise from corner to corner and secondly, the two trapeziums rotate 90 degrees anti-clockwise. However, the dark shaded trapezium disappears in the second and fourth square. In the missing square there should only be a trapezium with dotted shading which is horizontal and the small pentagon should be in the top right corner so the answer must be B.)

3. **C** - (As you move from left to right there are two changes in each square; firstly, the black rectangle at the top changes from being horizontal, to sloping downwards to sloping upwards. Secondly, the first three sets of stars and bottom rectangles are white and then the next three sets of stars and bottom rectangles are black. The missing square should have the top rectangle sloping downwards and the stars and bottom rectangle must be black so, the answer must be C.)
4. **C** - (As you move from left to right three changes happen in each square; firstly, the centre triangle of all the triangles changes from dotted shading to white to black and then this pattern is repeated. Secondly, the corner triangle with vertical lines moves clockwise around the corner triangles. Finally, the other two corner triangles that are white also move clockwise around the corner triangles. The missing square should have a centre triangle with dotted shading, the right hand corner triangle should have the vertical lines and the top and bottom corner triangle should be white so, the answer must be C.)

Missing Square

1. **B** - (From the top row you can see the only difference is that the shape from the left square has got smaller. By applying this to the bottom row you can work out that the missing square is B.)

2. **B** - (As you can see from the top two rows, the shapes are decreasing in size as they move from left to right and that is the only change. C is the same size as the bottom right square so the answer must be B.)

3. **A** - (In the bottom row you can see that the shape on the right has been rotated 90 degrees anti-clockwise to form the shape on the left. If you rotate the shape on the right in the top row 90 degrees anti-clockwise you will find that the answer is A.)

4. **B** - (As you move across the two completed rows from left to right, the number of one of the shapes in each square increases from 1 shape to 2 shapes to 3 shapes and the number of the other shape in each square decreases from 3 shapes to 2 shapes to 1 shape. As in the middle row, the right hand square has 1 rhombus and 3 ovals, it means that the missing square on the left should have 3 rhombi and 1 oval. The answer is therefore B. It can't be A as all of the shapes must be black.)
